

A Document Detailing the Vector Calculus Derivation of Magnetic Field Perpendicular to a Ring of Current

Author: Think the Duck

This is a document meant for the sole purpose of deriving the formula for the total magnetic field a distance from the center of and on the axis perpendicular to a ring of current. We will be doing this in cartesian coordinates.

By the Biot-Savart law, we have an equation for the magnetic field from a level of current.

$$d\vec{B} = \frac{\mu_0 I}{4\pi} \cdot \frac{d\vec{s} \times \hat{r}}{r^2} \quad (1)$$

Suppose our ring had a radius R , that our ring lay on the xy -plane, and that our point P were located at cartesian coordinates $(0, 0, z)$. This is a very idealized situation, but this is Physics, where we can afford to be idealized.

$d\vec{s}$ is an infinitesimally small arc length of the circle. It would roughly line up with the vector tangent to the circle at each given point, which would be the line of velocity of a point traveling around the circle.

$$d\vec{s} = \frac{d}{d\theta} \begin{pmatrix} R \cos(\theta) \\ R \sin(\theta) \\ 0 \end{pmatrix} d\theta = \begin{pmatrix} -R \sin(\theta) d\theta \\ R \cos(\theta) d\theta \\ 0 \end{pmatrix} \quad (2)$$

We know that $\hat{r} = \frac{\vec{r}}{|\vec{r}|}$, and we can assemble formulae for each of these. We should bear in mind that \vec{r} must be the vector from $d\vec{s}$ to the point P .

$$\vec{r} = \begin{pmatrix} -R \cos(\theta) \\ -R \sin(\theta) \\ z \end{pmatrix} \quad (3)$$

$$|\vec{r}| = \sqrt{(R \cos(\theta))^2 + (R \sin(\theta))^2 + z^2} = \sqrt{R^2 + z^2} \quad (4)$$

$$\hat{r} = \frac{1}{\sqrt{R^2 + z^2}} \begin{pmatrix} -R \cos(\theta) \\ -R \sin(\theta) \\ z \end{pmatrix} \quad (5)$$

Continued on next page...

Since we can draw out $\frac{1}{\sqrt{R^2+z^2}}$, we can calculate $d\vec{s} \times \vec{r}$ and apply $\frac{1}{\sqrt{R^2+z^2}}$ afterwards.

$$d\vec{s} \times \vec{r} = \begin{pmatrix} R \sin(\theta) d\theta \\ -R \cos(\theta) d\theta \\ 0 \end{pmatrix} \times \begin{pmatrix} -R \cos(\theta) \\ -R \sin(\theta) \\ r \end{pmatrix} \quad (6)$$

$$= \det \begin{bmatrix} \hat{i} & \hat{j} & \hat{k} \\ R \sin(\theta) d\theta & -R \cos(\theta) d\theta & 0 \\ -R \cos(\theta) & -R \sin(\theta) & r \end{bmatrix} \quad (7)$$

$$= \begin{vmatrix} -R \cos(\theta) d\theta & 0 \\ -R \sin(\theta) & r \end{vmatrix} \hat{i} + \begin{vmatrix} 0 & R \sin(\theta) d\theta \\ r & -R \cos(\theta) \end{vmatrix} \hat{j} + \begin{vmatrix} R \sin(\theta) d\theta & -R \cos(\theta) d\theta \\ -R \cos(\theta) & -R \sin(\theta) \end{vmatrix} \hat{k} \quad (8)$$

$$= \begin{pmatrix} Rz \cos(\theta) d\theta \\ Rz \sin(\theta) d\theta \\ R^2 \sin^2(\theta) d\theta + R^2 \cos^2(\theta) d\theta \end{pmatrix} = \begin{pmatrix} Rz \cos(\theta) \\ Rz \sin(\theta) \\ R^2 \end{pmatrix} d\theta \quad (9)$$

This is something we can plug into the Biot-Savart law to find our answer.

$$\vec{B} = \int d\vec{B} = \int_0^{2\pi} \frac{\mu_0 I}{4\pi} \cdot \frac{d\vec{s} \times \hat{r}}{r^2} = \frac{\mu_0 I}{4\pi} \int_0^{2\pi} \frac{d\vec{s} \times \hat{r}}{r^2} \quad (10)$$

$$= \frac{\mu_0 I}{4\pi} \int_0^{2\pi} \frac{1}{(R^2 + z^2)^{3/2}} \begin{pmatrix} Rz \cos(\theta) \\ Rz \sin(\theta) \\ R^2 \end{pmatrix} d\theta \quad (11)$$

$$= \frac{\mu_0 I}{4\pi (R^2 + z^2)^{3/2}} \int_0^{2\pi} \begin{pmatrix} Rz \cos(\theta) \\ Rz \sin(\theta) \\ R^2 \end{pmatrix} d\theta \quad (12)$$

$$= \frac{\mu_0 I}{4\pi (R^2 + z^2)^{3/2}} \begin{pmatrix} Rz \sin(\theta) \\ -Rz \cos(\theta) \\ R^2 \theta \end{pmatrix} \Big|_0^{2\pi} \quad (13)$$

$$= \frac{\mu_0 I}{4\pi (R^2 + z^2)^{3/2}} \begin{pmatrix} Rz(\sin(2\pi) - \sin(0)) \\ -Rz(\cos(2\pi) - \cos(0)) \\ R^2 * 2\pi \end{pmatrix} \quad (14)$$

$$= \frac{\mu_0 I}{4\pi (R^2 + z^2)^{3/2}} \begin{pmatrix} 0 \\ 0 \\ R^2 * 2\pi \end{pmatrix} \quad (15)$$

Continued on next page...

We can complete this in unit-vector notation rather than matrix vector notation, since we are only dealing with one dimension and unit vector.

$$\vec{B} = \frac{\mu_0 I R^2 * 2\pi \hat{k}}{4\pi (R^2 + z^2)^{3/2}} = \frac{\mu_0 I R^2}{2 (R^2 + z^2)^{3/2}} \hat{k} \quad (16)$$

This is indeed the answer we were looking for. This document has fulfilled its sole purpose.
