# 1 Problem 1

In Fig. 35-31, a light wave along ray  $r_1$  reflects once from a mirror and a light wave along ray  $r_2$  reflects twice from that same mirror and once from a tiny mirror at distance  $L$  from the bigger mirror. (Neglect the slight tilt of the rays.) The waves have wavelength 620 nm and are initially in phase. (a) What is the smallest value of  $L$  that puts the final light waves exactly out of phase? (b) With the tiny mirror initially at that value of  $L$ , how far must it be moved away from the bigger mirror to again put the final waves out of phase?
